Save

Instructions

- Develop a Kanban Board matching the UI
- Search UI
  - should search through entire board matching the input and display only matching cards
- Tags Filter UI
  - this is a dropdown component which displays available tags in the board
  - filter the board and display only matching cards
- Task Cards UI
  - link should open external url
  - upon clicking on the card with + icon, show Add a New Card UI in a modal
  - clicking on save should display the card as per the UI shown in the kanban board
  - assign a random task id without duplicates (eg., A1, A2, A3)
  - cards are movable between columns (to do, in development and completed)
  - cards can only move one step to the right (eg., a card in to do column can only move to in development and not to backlog or completed)
- Feel free to use ui assests and font from the internet
- Try to match the colors as shown in the image and use best judgement for css properties like margins, padding

Note:
For take home, submit the solution in a github project within the time limit.
